

Interoperability between OPC UA and oneM2M

Salvatore Cavalieri and Salvatore Mulè

University of Catania

Department of Electrical, Electronic and Computer Engineering (DIEEI)

IWES 2020

Research Scope

• The 4th industrial revolution (Industry 4.0- 14.0):

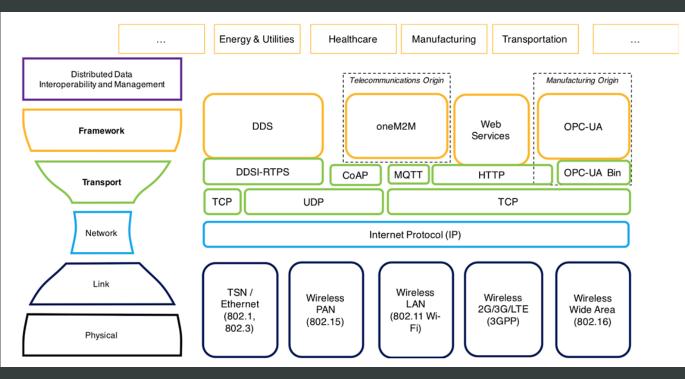

- Flexible and innovative production process leading to new business models and added value.
- Connecting business processes across company borders
- Some technologies:
 - Internet of Things (IoT) & Industrial IoT
 - Cloud Manufacturing
 - Industrial Analytics
 - Cyber-Physical Systems (CPS)
- One of the main requirements:
 - Interoperability
 - Definition of Reference Architectures: RAMI 4.0, IIRA

Research Scope

Industrial Internet Reference Architecture (*IIRA*) by the IIC (Industrial Internet Consortium)^[1]

- > Solutions for getting data between applications
- Transport and Framework layer

[1] Industrial Internet Consortium. 2018. The Industrial Internet of Things Volume G5: Connectivity Framework (Version 1.01), available at https://www.iiconsortium.org/pdf/IIC_PUB_G5_V1.01_PB_20180228.pdf

- In order to achieve interoperability IIRA defines **Gateways** enabling inteworking between different frameworks
- Very recent draft version of the gateway between OPC UA and DDS ^[2] has been defined

• No other Gateways exist

[2] Object Management Group (OMG), "OPC UA/DDS Gateway", available at https://www.omg.org/spec/DDS-OPCUA/About-DDS-OPCUA/

Interworking between OneM2M and OPC UA

ONEM2M

- placed at the higher level of factory production systems, allowing realization of services like SCM
- advanced data analytics

OPCUA

- adopted in factories at the lower level of the production systems
- typically collect data coming from PLCs (Programmable Logic Controllers), sensors and actuators.

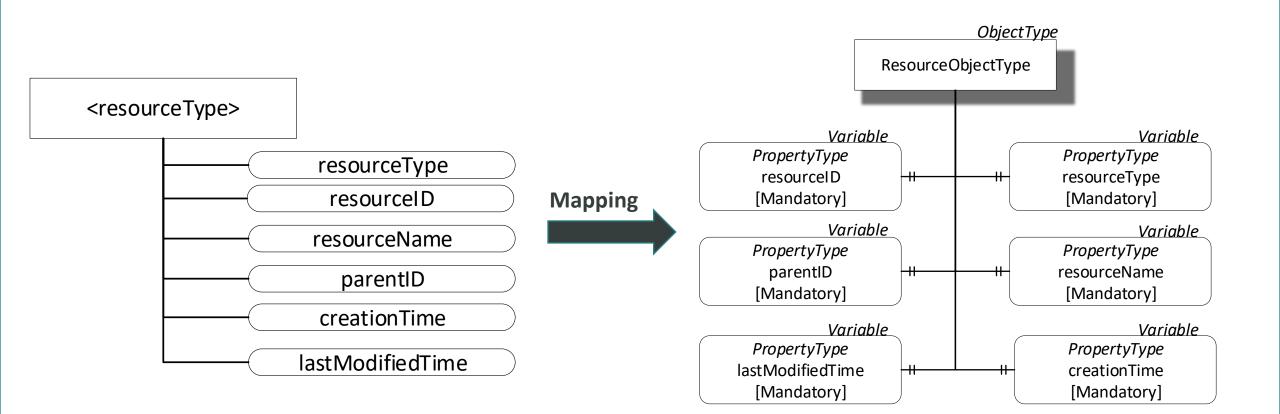

Interworking between OPC UA and oneM2M may allow data produced by OPC UA-based devices to be consumed by oneM2M applications;

Our proposal

- 1. Mapping relevant data models [1]
- 2. Definition of an interworking scheme [2]
- 3. Details on interworking procedures
- 4. API Development

Mapping - Data Models

oneM2M resourceType representation with universal attributes

ResourceObjetType ObjectType in OPC UA

Mapping – Interworking scheme

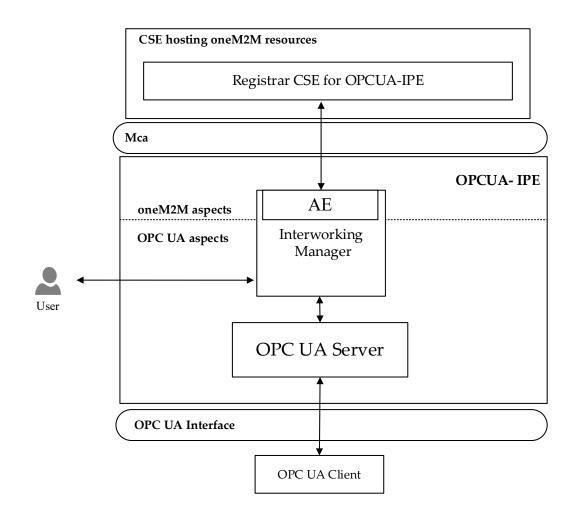

Figure 8. OPCUA-IPE architecture.

- Based on Interworking Proxy
 Entity (IPE) defined in oneM2M
- Interworking Manager performs several activities to enable interworking
- OPC UA Server exposing oneM2M resources

Mapping – Interworking scheme

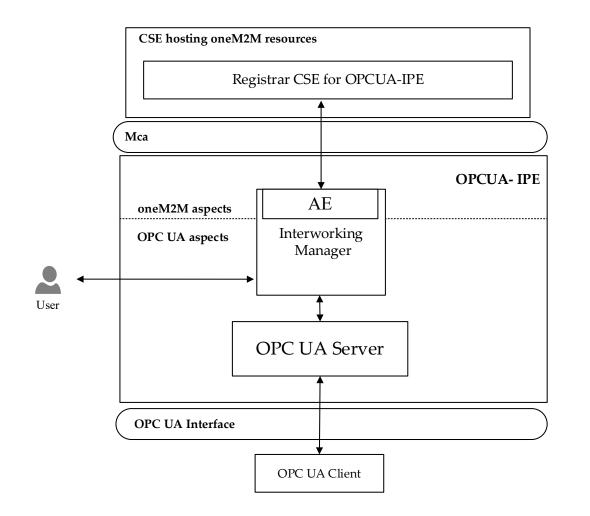

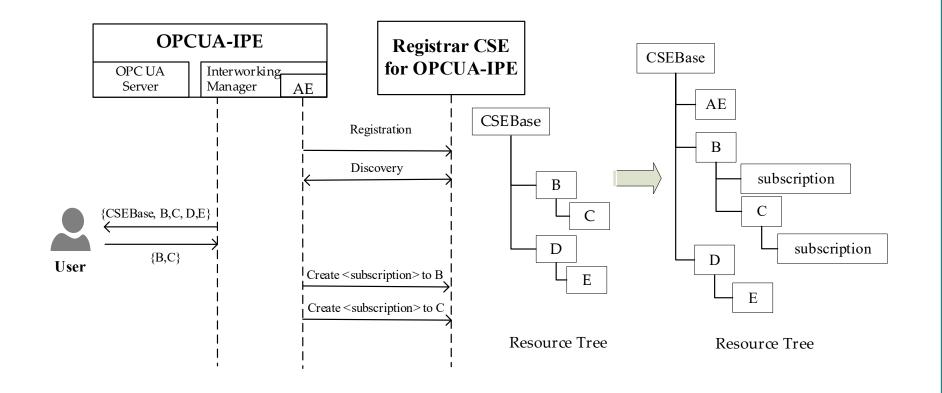

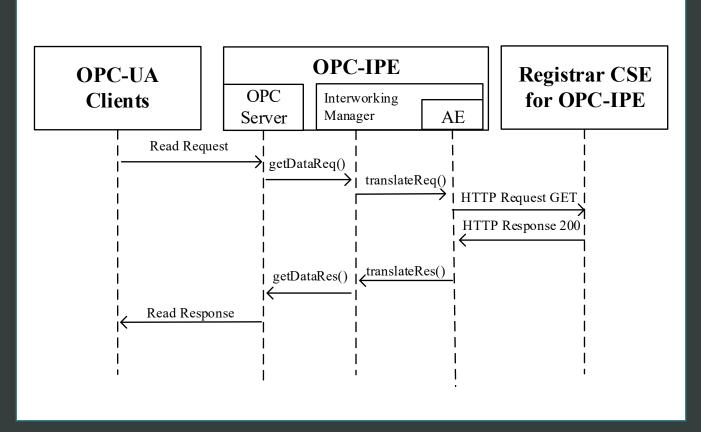

Figure 8. OPCUA-IPE architecture.

- Data Mapping
- Choice of oneM2M resources to be exposed
- Creation of an OPC UA Server instance
- Triggering changes
- Monitoring Request
- Managing the dynamic adding/deletion

Resource Selection - Discovery

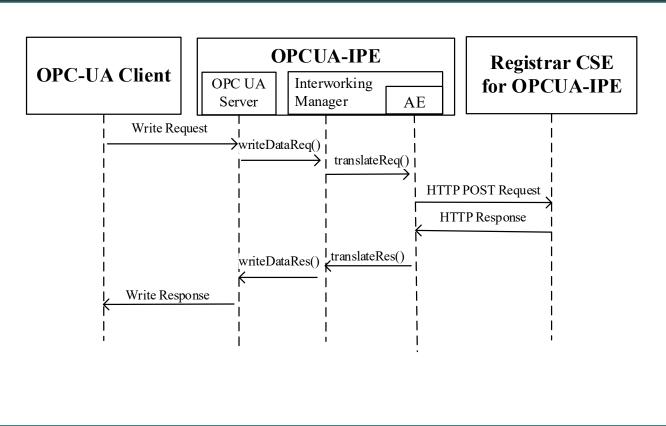

Interworking Procedures – Read

Read request from OPC UA Client mapped as **HTTP GET Request**:

- Interworking Manager translate request and waiting for response;
- Value from HTTP GET returned to OPC UA Client ;

Interworking Procedures – Write

Write request from OPC UA Client mapped as HTTP POST Request:

- Interworking Manager translate request and waiting for response
- Write response will be confirmed by Interworking Manager

API Development

- Resource discovery service
- Mapping oneM2M resource in OPC UA Node
- Request Management from OPC UA Side (Read, Write, MonitoredItem)
- Data changes triggering

Test:

CSE Base Docker Image

UaExpert

Local OPCUA IPE :

- OPC UA Server with FreeOPCUA open source library;
- OpenMTC SDK
